- a ;noiteramune ro ,noinu ,eruturts a fo redmem a ro gat a ;noitenut a ;tojedo na etoneb nao reditine can denote typedef name; a label name; a macro name; or a macro parameter. The same identifier can denote noiteramune na bellas ai noiteramune na fo redmem A .margorq et ni stnioq thereflib ta seititne therestant to the constant. Macro names and macro parameters are not considered further here, because prior to the yet besales are ali estimated to seam to escape the constitute their macro definitions.
- 2 For each different entity that an identifier designates, the identifier is visible (i.e., can be used) only within a region of program text called its scope. Different entities designated by the same identifier either which is scopes to see a propose of the propose of the scopes of the scopes. There are four kinds of scopes its prototype. (A *function prototype* is a declaration of a function that declares the types of its careful function prototype. (A *function prototype* is a declaration of a function that declares the types of its careful function prototype.)
- (tnementate otog a ni) besu ed nas and is declared implicitly by its syntactic appearance anywhere in the function in which it appears, and is declared implicitly by its syntactic appearance (tnementate a base).
- eqyt ro rotsralob a ni) noitsralob sti fo themseld ed yet benimier appears outside of any block or list specifier). If the declarator or type specifier that declares the identifier appears outside of any block or list and it. Jinu noitslenated that the set of the set of themseld in the set of themseld and the specifier that declares the identifier appears inside a block or within the list of declarator or type specifier that declares the identifier appears are in a noiting themseld block. If the declarator or type specifier that declares the identifier appears within the sate associated block. If the declarator or type specifier that declares the identifier appears within the set reiliting that the interior prototype scope, which terminates at the end of the function declarator. If an identifier designates function prototype scope, which terminates at the end of the function declarator. If an identifier designates and the interscope will be a strict subset of the scope of the other entity (the outer scope). Within the inner scope, wied and not visible) within the inner scope.
- ot ot some entity (as opposed to the syntactic construct), it refers to the entity in the relevant name refer to some entity (as opposed to the syntactic construct), it refers to the entity in the relevant name space whose declaration is aldieiv either to some entity (as opposed to the syntactic construct).
- 6 Two identifiers have the *same scope* if and only if their scopes terminate at the same point.
- s ni gat adt to soneraeque and rathe stuj eniged that equal equal equal equal equal equal equal type specifier that declares the tag. Each enumeration constant has scope that begins just after the eniged that equal e
